Low power audio DAC

UDA1334BTS

1 FEATURES**1.1 General**

- 1.8 to 3.6 V power supply voltage
- Integrated digital filter plus DAC
- Supports sample frequencies from 8 to 100 kHz
- Automatic system clock versus sample rate detection
- Low power consumption
- No analog post filtering required for DAC
- Slave mode only applications
- Easy application
- SSOP16 package.

1.2 Multiple format data interface

- I²S-bus and LSB-justified format compatible
- 1f_s input data rate.

1.3 DAC digital sound processing

- Digital de-emphasis for 44.1 kHz sampling rate
- Mute function.

1.4 Advanced audio configuration

- High linearity, wide dynamic range and low distortion
- Standby or Sleep mode in which the DAC is powered down.

4 ORDERING INFORMATION

TYPE NUMBER	PACKAGE		
	NAME	DESCRIPTION	VERSION
UDA1334BTS	SSOP16	plastic shrink small outline package; 16 leads; body width 4.4 mm	SOT369-1

BITSTREAM CONVERSION

2 APPLICATIONS

This audio DAC is excellently suitable for digital audio portable application, such as portable MD, MP3 and DVD players.

3 GENERAL DESCRIPTION

The UDA1334BTS supports the I²S-bus data format with word lengths of up to 24 bits and the LSB-justified serial data format with word lengths of 16, 20 and 24 bits.

The UDA1334BTS has basic features such as de-emphasis (at 44.1 kHz sampling rate) and mute.

Low power audio DAC

UDA1334BTS

5 QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
Supplies						
V_{DDA}	DAC analog supply voltage		1.8	2.0	3.6	V

7 PINNING

SYMBOL	PIN	PAD TYPE	DESCRIPTION
BCK	1	5 V tolerant digital input pad; note 1	bit clock input
WS	2	5 V tolerant digital input pad; note 1	word select input
DATAI	3	5 V tolerant digital input pad; note 1	serial data input
V _{DDD}	4	digital supply pad	digital supply voltage
V _{SSD}	5	digital ground pad	digital ground
SYSCLK	6	5 V tolerant digital input pad; note 1	system clock input
SFOR1	7	5 V tolerant digital input pad; note 1	serial format select 1
MUTE	8	5 V tolerant digital input pad; note 1	mute control
DEEM	9	5 V tolerant digital input pad; note 1	de-emphasis control
PCS	10	3-level input pad; note 2	power control and sampling frequency select
SFOR0	11	digital input pad; note 2	serial format select 0
V _{ref(DAC)}	12	analog pad	DAC reference voltage
V _{DDA}	13	analog supply pad	DAC analog supply voltage
VOUTL	14	analog output pad	DAC output left
V _{SSA}	15	analog ground pad	DAC analog ground
VOUTR	16	analog output pad	DAC output right

Notes

1. 5 V tolerant is only supported if the power supply voltage is between 2.7 and 3.6 V. For lower power supply voltages this is maximum 3.3 V tolerant.
2. Because of test issues these pads are not 5 V tolerant and they should be at power supply voltage level or at a maximum of 0.5 V above that level.

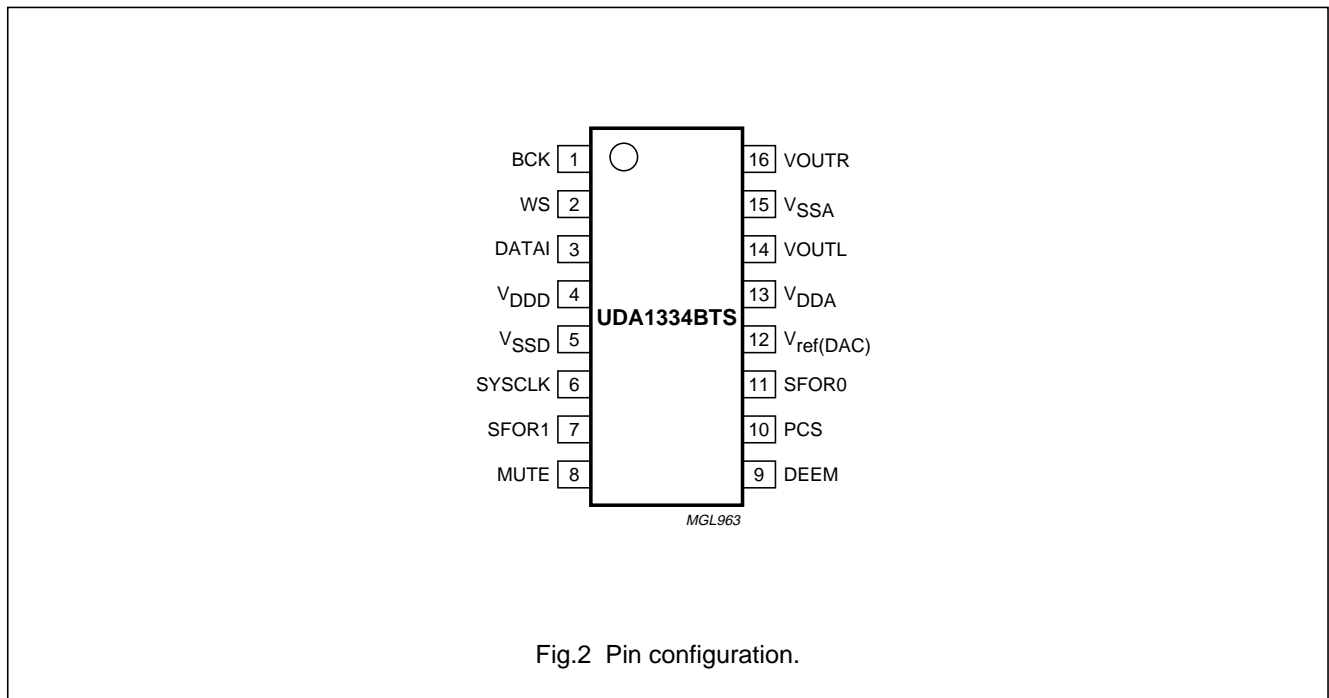

Fig.2 Pin configuration.

Low power audio DAC

UDA1334BTS

8 FUNCTIONAL DESCRIPTION**8.1 System clock**

The UDA1334BTS operates in slave mode only; this means that in all applications the system must provide the system clock and the digital audio interface signals (BCK and WS).

The system clock must be locked in frequency to the digital interface signals.

The UDA1334BTS automatically detects the ratio between the SYSCLK and WS frequencies.

The BCK clock can be up to $64f_s$, or in other words the BCK frequency is 64 times the Word Select (WS) frequency or less: $f_{BCK} \leq 64 \times f_{WS}$.

Remarks:

1. The WS edge MUST fall on the negative edge of the BCK at all times for proper operation of the digital I/O data interface
2. For LSB-justified formats it is important to have a WS signal with a duty factor of 50%.

The modes which are supported are given in Table 1.

Table 1 Supported sampling ranges

CLOCK MODE	SAMPLING RANGE
$768f_s$	8 to 55 kHz
$512f_s$	8 to 100 kHz
$384f_s$	8 to 100 kHz
$256f_s$	8 to 100 kHz
$192f_s$	8 to 100 kHz ⁽¹⁾⁽²⁾
$128f_s$	8 to 100 kHz ⁽²⁾

Notes

1. This mode can only be supported for power supply voltages down to 2.4 V. For lower voltages, in $192f_s$ mode the sampling frequency should be limited to 55 kHz.
2. Not supported in the low sampling frequency mode.

An example is given in Table 2 for a 12.228 MHz system clock input.

Table 2 Example using a 12.228 MHz system clock

CLOCK MODE	SAMPLING FREQUENCY
$128f_s$	96 kHz
$192f_s$	64 kHz ⁽¹⁾
$256f_s$	48 kHz
$384f_s$	32 kHz
$512f_s$	24 kHz
$768f_s$	16 kHz

Note

1. This mode can only be supported for power supply voltages down to 2.4 V. For lower voltages, in $192f_s$ mode the sampling frequency should be limited to 55 kHz.

8.2 Interpolation filter

The interpolation digital filter interpolates from $1f_s$ to $64f_s$ by cascading FIR filters (see Table 3).

Table 3 Interpolation filter characteristics

ITEM	CONDITION	VALUE (dB)
Pass-band ripple	0 to $0.45f_s$	± 0.02
Stop band	$>0.55f_s$	-50
Dynamic range	0 to $0.45f_s$	>114

8.3 Noise shaper

The 5th-order noise shaper operates at $64f_s$. It shifts in-band quantization noise to frequencies well above the audio band. This noise shaping technique enables high signal-to-noise ratios to be achieved. The noise shaper output is converted into an analog signal using a Filter Stream DAC (FSDAC).

Low power audio DAC

UDA1334BTS

8.4 Filter stream DAC

The FSDAC is a semi-digital reconstruction filter that converts the 1-bit data stream of the noise shaper to an analog output voltage. The filter coefficients are implemented as current sources and are summed at virtual ground of the output operational amplifier. In this way very high signal-to-noise performance and low clock jitter sensitivity is achieved. No post-filter is needed due to the inherent filter function of the DAC. On-board amplifiers convert the FSDAC output current to an output voltage signal capable of driving a line output.

The output voltage of the FSDAC scales proportionally with the power supply voltage.

8.5 Power-on reset

The UDA1334BTS has an internal Power-on reset circuit (see Fig.3) which resets the test control block.

The reset time (see Fig.4) is determined by an external capacitor which is connected between pin $V_{ref(DAC)}$ and ground. The reset time should be at least $1 \mu s$ for $V_{ref(DAC)} < 1.25 V$. When V_{DDA} is switched off, the device will be reset again for $V_{ref(DAC)} < 0.75 V$.

During the reset time the system clock should be running.

Low power audio DAC

UDA1334BTS

8.6 Feature settings

The features of the UDA1334BTS can be set by control pins SFOR1, SFOR0, MUTE, DEEM and PCS.

8.6.1 DIGITAL INTERFACE FORMAT SELECT

The digital audio interface formats (see Fig.5) can be selected via the pins SFOR1 and SFOR0 as shown in Table 4.

Table 4 Data format selection

SFOR1	SFOR0	INPUT FORMAT
LOW	LOW	I ² S-bus input
LOW	HIGH	LSB-justified 16 bits input
HIGH	LOW	LSB-justified 20 bits input
HIGH	HIGH	LSB-justified 24 bits input

8.6.2 MUTE CONTROL

The output signal can be soft muted by setting pin MUTE to HIGH level as shown in Table 5.

Table 5 Mute control

MUTE	FUNCTION
LOW	mute off
HIGH	mute on

8.6.3 DE-EMPHASIS CONTROL

De-emphasis can be switched on for $f_s = 44.1$ kHz by setting pin DEEM at HIGH level. The function description of pin DEEM is given in Table 6.

Table 6 De-emphasis control

DEEM	FUNCTION
LOW	de-emphasis off
HIGH	de-emphasis on

Remark: the de-emphasis function is only supported in the normal operating mode, not in the low sampling frequency mode.

8.6.4 POWER CONTROL AND SAMPLING FREQUENCY SELECT

Pin PCS is a 3-level pin and is used to set the mode of the UDA1334BTS. The definition is given in Table 7.

Table 7 PCS function definition

PCS	FUNCTION
LOW	normal operating mode
MID	low sampling frequency mode
HIGH	Power-down or Sleep mode

The low sampling frequency mode is required to have a higher oversampling rate in the noise shaper in order to improve the signal-to-noise ratio. In this mode the oversampling ratio of the noise shaper will be $128f_s$ instead of $64f_s$.

9 LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 60134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DD}	supply voltage	note 1	–	4.0	V
$T_{xtal(max)}$	maximum crystal temperature		–	150	°C
T_{stg}	storage temperature		–65	+125	°C
T_{amb}	ambient temperature		–40	+85	°C
V_{es}	electrostatic handling voltage	human body model	–2000	+2000	V
		machine model	–200	+200	V
$I_{sc(DAC)}$	short-circuit current of DAC	note 2			
		output short-circuited to V_{SSA}	–	450	mA
		output short-circuited to V_{DDA}	–	300	mA

Note

- All supply connections must be made to the same power supply.
- Short-circuit test at $T_{amb} = 0\text{ °C}$ and $V_{DDA} = 3\text{ V}$. DAC operation after short-circuiting cannot be warranted.

10 HANDLING

Inputs and outputs are protected against electrostatic discharge in normal handling. However, it is good practice to take normal precautions appropriate to handling MOS devices.

11 THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	VALUE	UNIT
$R_{th(j-a)}$	thermal resistance from junction to ambient	in free air	145	K/W

12 QUALITY SPECIFICATION

In accordance with “SNW-FQ-611-E”.

13 DC CHARACTERISTICS

$V_{DDD} = V_{DDA} = 2.0\text{ V}$; $T_{amb} = 25\text{ °C}$; $R_L = 5\text{ k}\Omega$; all voltages with respect to ground (pins V_{SSA} and V_{SSD}); unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT

DAC							
V _{ref(DAC)}	reference voltage	with respect to V _{SSA}	0.45V _{DDA}	0.5V _{DDA}	0.55V _{DDA}	V	
R _{o(ref)}	output resistance on pin V _{ref(DAC)}		–	12.5	–	kΩ	
I _{o(max)}	maximum output current	(THD + N)/S < 0.1%; R _L = 800 Ω	–	tbF	–	mA	
R _L	load resistance		3	–	–	kΩ	
C _L	load capacitance	note 3	–	–	50	pF	

Notes

1. All supply connections must be made to the same external power supply unit.
2. At 3 V supply voltage, the input pads are TTL compatible. However, at 2.0 V supply voltage no TTL levels can be accepted, but levels from 3.3 V domain can be applied to the pins.
3. When the DAC drives a capacitive load above 50 pF, a series resistance of 100 Ω must be used to prevent oscillations in the output operational amplifier.

17 SOLDERING

17.1 Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"Data Handbook IC26; Integrated Circuit Packages"* (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering is not always suitable for surface mount ICs, or for printed-circuit boards with high population densities. In these situations reflow soldering is often used.

17.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several methods exist for reflowing; for example, infrared/convection heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to 250 °C. The top-surface temperature of the packages should preferably be kept below 230 °C.

17.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
 - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
 - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

17.4 Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

Low power audio DAC

UDA1334BTS

17.5 Suitability of surface mount IC packages for wave and reflow soldering methods

PACKAGE	SOLDERING METHOD	
	WAVE	REFLOW ⁽¹⁾
BGA, LFBGA, SQFP, TFBGA	not suitable	suitable
HLQFP, HSQFP, HSOP, HTQFP, HTSSOP, SMS	not suitable ⁽²⁾	suitable
PLCC ⁽³⁾ , SO, SOJ	suitable	suitable
LQFP, QFP, TQFP	not recommended ⁽³⁾⁽⁴⁾	suitable
SSOP, TSSOP, VSO	not recommended ⁽⁵⁾	suitable

Notes

- All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the "Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods".
- These packages are not suitable for wave soldering as a solder joint between the printed-circuit board and heatsink (at bottom version) can not be achieved, and as solder may stick to the heatsink (on top version).
- If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
- Wave soldering is only suitable for LQFP, TQFP and QFP packages with a pitch (e) equal to or larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
- Wave soldering is only suitable for SSOP and TSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.

18 DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

19 LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
